

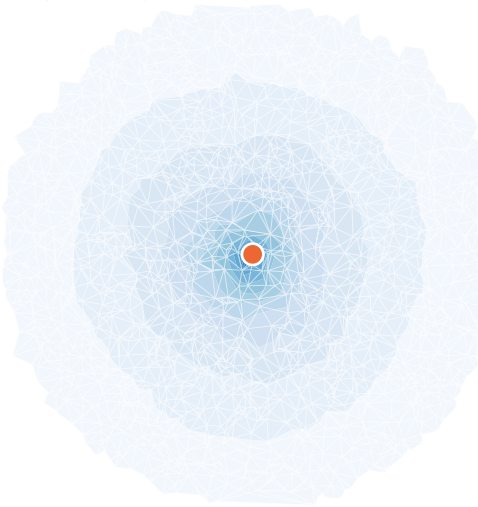

Figure 2. Gravity is the grid's tension, shared out link by link

(a) A mass pulls on the net

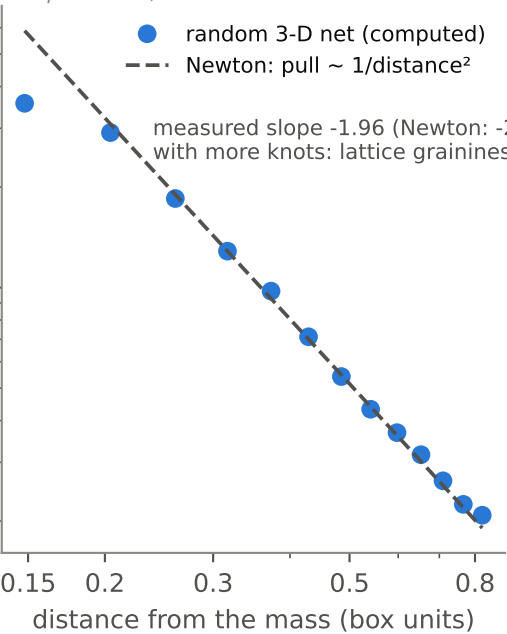

computed: equilibrium of a 2-D random network

a random net, tension only; the mass pulls one knot.
darker = pulled further. Every knot shares the load
with its neighbours, so the dip spreads out smoothly.

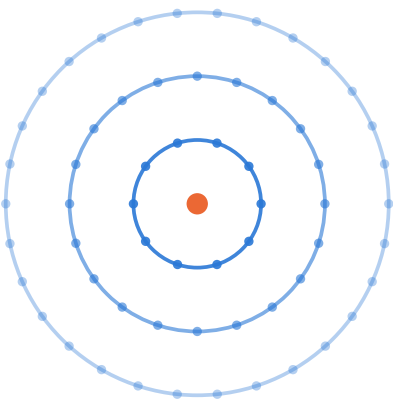

(b) The pull falls as $1/r^2$

computed: 24,000-knot random 3-D network

(c) Why $1/r^2$

picture

the same pull is shared by every link crossing
a shell; a shell twice as far has 4x as many,
so each carries 1/4: the inverse-square law.
