

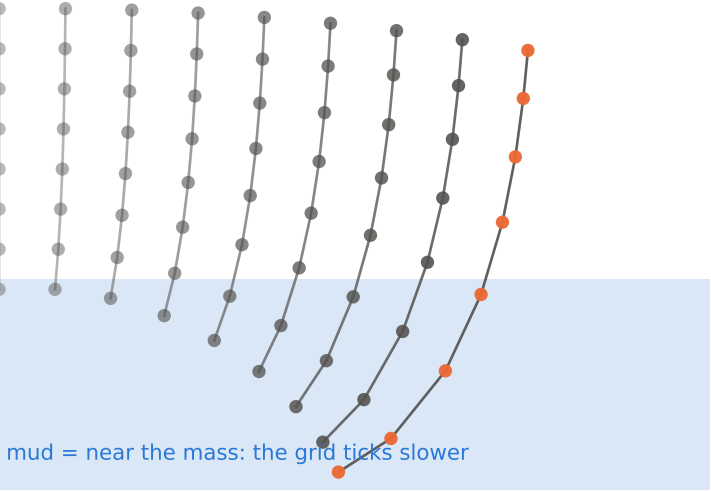

Figure 3. What gravity actually is: the grid ticks slower near mass, and paths bend toward slow ticking

(a) Falling = turning toward slower ticks

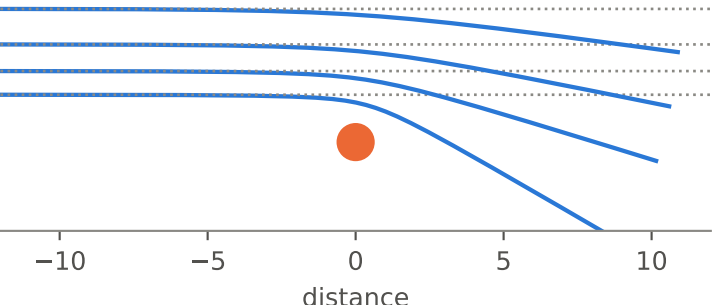

picture (computed toy: step length = local tick rate)

a marching band whose lower ranks reach mud
each row turns toward the slow side:
no rope pulls it; the path itself bends

(b) Light takes the same bent path

computed: ray tracing through the tick-rate field (exaggerated)

dotted: straight lines. Rays passing closer bend more.
The Sun bends starlight by 1.75" (measured 1919 onward);
here the mass is exaggerated $\sim 10^5$ times.
