

Figure 5. The fluid between the layers: pulled by gravity, invisible, and it passes through itself

(a) A galaxy sits in a pool of fluid

picture (profile drawn from a CDM-like halo)

orange: stars and gas. blue: the fluid it has gathered (5-6x more mass). The pool holds the outer stars in orbit (flat rotation curves).

(b) Why we need the fluid

computed: SPARC data, Newtonian + cored halo fit

(c) Two clusters after a collision

picture of the Bullet Cluster observation
