

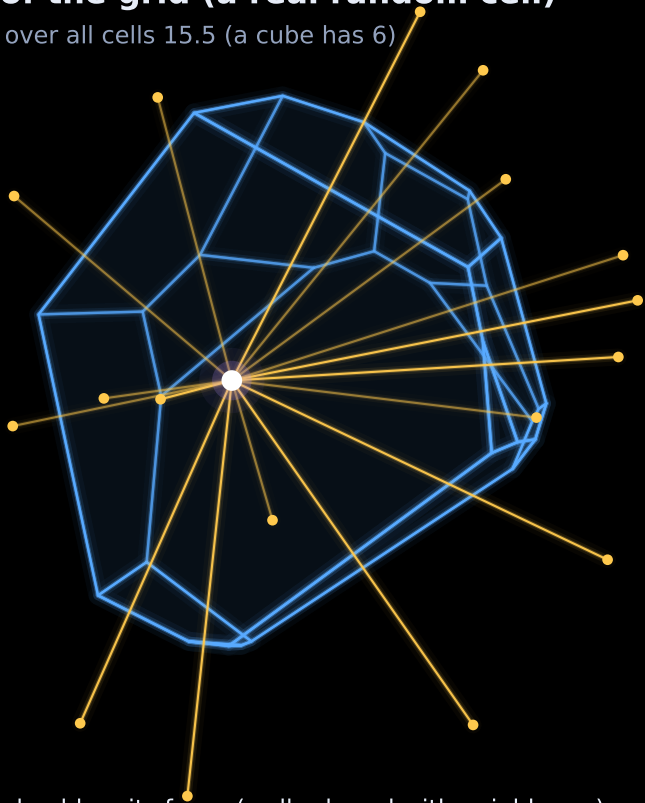

Figure 10. The grid's building block: a random cell, its links, and the size it must have

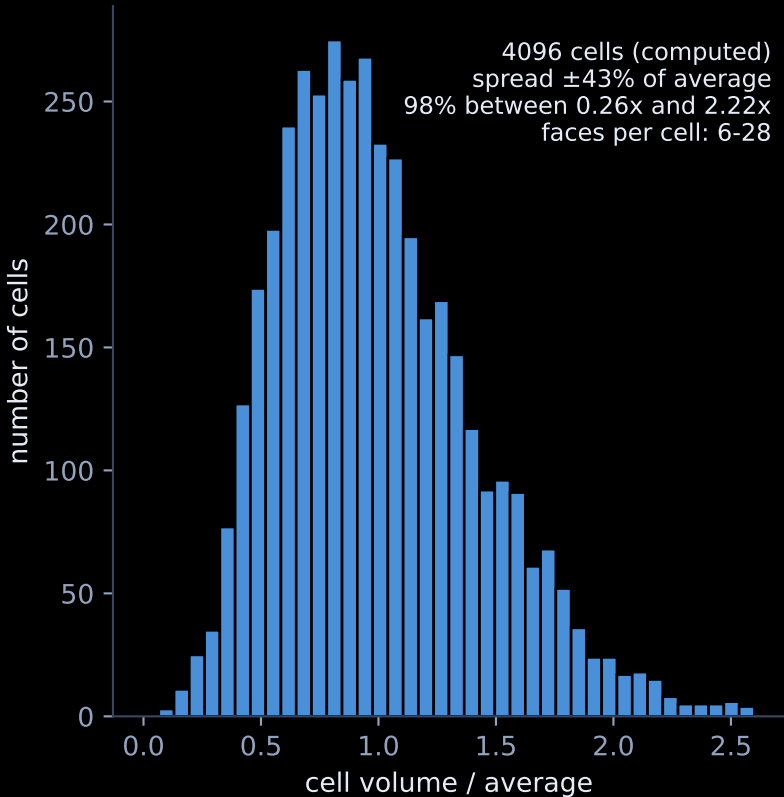

(a) One cell of the grid (a real random cell)

17 faces; average over all cells 15.5 (a cube has 6)

white: the cell's node blue: its faces (walls shared with neighbours)
gold: its links, one through each face to a neighbouring node.
Tension is carried along the links; each link's strength is set by the area of the face it passes through.

(b) Cells come in a spread of sizes

(c) How big can a cell be?
